ECG Interpretation: Beyond Recognition
Mini-Elective
Spring 2017

Course Dates: January 27, February 10, 17, 24
Fridays, 1:00-2:30 PM

Maximum Students: 15

Class Year: MS2

Course Director: Jason S. Chang, MD
Assistant Professor of Emergency Medicine

Contact Information: Jason S. Chang, MD
changjs2@upmc.edu

Registration: Betsy Nero, Office of Medical Education
betsy@medschool.pitt.edu

Description:
Many medical students who look at an ECG today instinctively resort to pattern
recognition when asked to identify an abnormal finding (e.g. “saw-tooth pattern”
means atrial flutter; “rabbit ears” means a right bundle branch block). This is an
ineffective means of ECG interpretation. Rote memorization of ECG patterns does
little to promote an understanding of the basic pathophysiology behind arrhythmi-
as and other abnormalities. The goal of this mini-elective is to present an inter-
active and in-depth examination of the electrical pathophysiology behind the pat-
terns that are associated with common emergency arrhythmias and ECG abnor-
malities. Developing an understanding of these mechanisms will allow the stu-
dent to interpret a variety of pathology simply by being able to explain the elec-
trical activity and depolarization patterns within the myocardium.

Course Objectives:
1. Provide a review of the normal electrical depolarization patterns and the typi-
cal 12-lead ECG
2. Generate illustrative explanations of the electrical activity behind many indi-
vidual ECG arrhythmias and abnormalities
3. Discuss several case presentations of emergency ECG abnormalities and man-
agement strategy based on a simple ECG
4. Predict and create ECG rhythms when presented with illustrative examples of
abnormal electrical depolarization patterns

Requirements:
- Attendance at each session
- Completion of Cardiology block
Course Outline:
“ECG Interpretation - Beyond Recognition”

Course Director:
Jason S. Chang, MD
Assistant Professor of Emergency Medicine

Location:
January 27, 2017—Scaife Hall, Room 502 & 503
All other sessions—Scaife Hall—Rooms 472 A&B

Week 1:
Standard 12-Lead ECG interpretation and approach to understanding a normal ECG
The first week of this course will review the standard ECG including reinforcement of the basic concepts behind the morphology behind a normal depolarization through the myocardium. This will include discussion of the anatomy of the heart, orientation of the electrical leads, pattern of depolarization from atrium to ventricle, and the anticipated normal ECG recordings. We will then introduce disturbances to the ECG rhythm when abnormal or ectopic depolarizations disrupt this regular sequence of events.

Week 2:
Supraventricular Arrhythmias and Conduction Abnormalities
After understanding a normal ECG, we will begin to discuss individual rhythm and conduction abnormalities originating from above the ventricle. The student will participate in illustrating the electrical mechanisms behind common atrial and AV nodal diseases while appreciating the central role the AV node plays in controlling and coordinating atrial to ventricular electrical communication, particularly when there is an abnormality within the AV nodal junction.

Week 3:
Ventricular Arrhythmias and Conduction Abnormalities; ST segment changes
The most deadly arrhythmias occur when they originate from within the ventricles. The student will be able to find parallels to atrial arrhythmias after discussing the mechanisms behind ventricular arrhythmias. This week will also explore some of the reasons behind basic ACLS guidelines and resuscitative measures for patients in cardiac arrest. Though not a primary objective of the course, ST segment changes will also be briefly discussed to introduce the concept of myocardial damage and its effect on the ECG.

Week 4:
ECG Case Reviews and Illustrative Application of Knowledge
Students will discuss several examples of ECG abnormalities framed by case presentations. We will reinforce the idea of interpreting an ECG without relying on pattern recognition and apply learning points presented in the previous weeks. Finally, the students will be challenged to create ECG rhythms based on pictorial illustrations of abnormal electrical activity. This will reverse the concept of ECG interpretation and instead force the trainee to understand how ECG patterns are created.
